Klinik Wissen 360

Eine Marke von Moritz Wagener Consulting

PRODUCT INFORMATION / BETA

Find clinic knowledge. Trace its approved status.

I am developing Klinik Wissen 360 as a knowledge system for an organisation's internal standards, processes and training material. The intended foundation is content that the clinic can lawfully provide and has approved for the intended use.

A publisher-independent core

A clinic should be able to organise and find its own knowledge without requiring content from any particular publisher or paid provider. Specialist literature and publisher connections remain optional and interchangeable.

Verified status: internal development and demonstration

The Beta supports knowledge spaces containing source references and personal notes. This does not mean that their contents have been analysed automatically. The central ChatGPT connection has not been released for production; automatic AI content analysis is not active there.

Market readiness is planned for 2027. This is not a binding availability date or approval for operation at any particular organisation. External testing requires a personal agreement and separate authorisation. There is no open registration.

01 / SOURCES AND QUALITY

From documents to a reviewable knowledge base

The target workflow begins with valid sources and human responsibility. Implementing and accepting this complete workflow remains a development task.

Provide content lawfully

SOPs, process descriptions, organisational documents and training knowledge come from a defined collection. The intended use and the rights required for each item must be clarified.

Approve and version the content

Provenance, rights holder, version, validity, review date and professional responsibility should be visible for each source. Originals, locally approved knowledge and future AI drafts must remain distinguishable.

Find information and check the original

Search and original-source viewing should work without generative AI. A source identifier or abstract does not replace checking the original. Missing or unsuitable evidence must be made visible; the system must abstain from answering when necessary.

Review changes in a controlled process

Outdated, contradictory or withdrawn sources require professional review. External recommendations must not automatically overwrite a local SOP. Approval remains with the people authorised to give it.

> Illustrative organisational example - not a client reference
>
> A new employee needs the approved procedure for requesting supplies. The objective is to find the valid version, the person responsible and the next review date. A new external recommendation should trigger review, not an automatic change to the local standard.

AI-assisted analyses serve as a working aid. Source references and visible gaps support review but do not guarantee completeness or accuracy. Results must be checked against original sources; professional assessment remains with the responsible people.

02 / RIGHTS AND INDEPENDENCE

Source rights stay intact. Knowledge remains portable.

Public accessibility or a clinic subscription does not automatically permit commercial AI processing.

Five uses require five separate checks

Storage, indexing, quotation, AI summaries and model training must be assessed separately for each source. No automatic full-text import is envisaged when rights are unclear.

Clinic knowledge remains bound to its authorisation

Without separate permission, clinic knowledge must not be shared across clinics or used for model training. This also applies when changing search, embedding or language-model providers.

Planned technical independence

The knowledge collection, rights, approvals and version history should remain separate from any particular AI provider. Search, embedding and language-model components should be interchangeable. Losing generative AI must not make search and original-source viewing unusable.

Export and recovery need practical testing

The plan includes usable exports with metadata and approval status, subject to the relevant rights. Provider changes, recovery and permission separation between organisations must later be tested in practice. These tests have not yet established operational readiness.

Specialist content is an optional addition

A publisher directory does not prove an active integration or existing usage rights. Stored licence details and IP ranges do not confirm full-text access. Institutional models priced on request require a dated, binding offer for the specific organisation and agreed scope. Estimated prices are not approved order prices.

The requested ChatGPT connection using a customer's own plan has not been released for production. Sign-in, usage permission, data authorisation and cost approval are separate steps. Unavailable AI functions must remain blocked; another model or a billable replacement account must not take over silently.

03 / PILOT AND OPERATION

A bounded pilot. Clear prerequisites.

The first use case should be an organisational process within one department. A pilot partner and professional reviewers still need to be found.

Starting proposal for evaluation

20-30 approved documents and around 50 professionally reviewed questions. Patient data and individual diagnostic or therapeutic recommendations are excluded. This sample is a starting proposal, not general evidence of clinical safety.

Agree the conditions before starting

The task, document collection, permitted uses, professional responsibilities, roles and access boundaries must be agreed. Intended purpose, privacy and regulatory requirements require separate review. Operation, support and stop/fallback procedures are part of preparation.

Evaluate the benefit on specific tasks

The evaluation should compare finding a valid version, time required, detected incorrect or outdated results and questions that cannot be answered. Human reviewers check source references, versions and agreed boundaries. Targets and acceptance criteria are set before evaluation; no results or returns are promised.

Separate implementation and ongoing costs

Planning must include professional review and rights clearance as well as setup, operation, support and updates. Implementation, ongoing platform/service work and optional source licences are considered separately. Prices, budgets and business outcomes have not been contractually agreed.

Start with a concrete task

Describe an organisational process where approved knowledge is difficult to find or maintain. I will explain the development status and prerequisites for possible evaluation. An enquiry is not an appointment confirmation, an order or operational approval.

04 / OPTIONAL CONTENT LICENCES

Publisher licences remain a separate decision.

The sections below describe the licence and procurement model and the conditions to be agreed. The routes actually available in a personally authorised evaluation must be checked for its agreed scope. This is not a new operational acceptance.

LICENCE MODEL

Bring Your Own License — your publisher licences remain yours

Klinik Wissen 360 clearly separates SaaS access from content licences. You use the platform while your existing publisher agreements remain unchanged.

Own licence (BYOL)

Stored licence information can indicate an access route. Whether your existing licence covers the specific title and intended use, and whether the full text is actually accessible, must be checked with the provider. MWC is not a contracting party of the publisher and does not charge a handling fee for this route.

Procurement via MWC (Single Creditor)

If a licence is missing, Moritz Wagener Consulting can procure access, act as the sole invoice issuer and list a transparent handling fee as a separate line item.

Both routes in parallel

Per tenant you can freely choose which titles run via own licences and which are procured through MWC. The licence route is visible on every result.

> **Publisher terms remain applicable**
>
> The terms of use of the respective publisher apply regardless of the licence route.

An enquiry, a stored licence indication or an AI result does not trigger a paid order. Paid procurement requires separate clarification and approval.

05 / DATA AND RESPONSIBILITY

Data flows must match the authorised scope.

The public data-processing notes below remain substantively unchanged. Actual data and access routes must be checked against them before external evaluation. Beta status does not waive privacy or rights requirements.

DATA PROCESSING & FULL-TEXT ACCESS

Data used in searches and full-text access

Klinik Wissen 360 supports searches, knowledge organisation and the assessment of full-text access routes. These notes explain which data is processed during searches and full-text access.

Data used for operation and traceability

- Account and tenant data: name, e-mail address, role and organisation membership.
- Licence and access configuration of your organisation: publisher licences, network ranges, remote access.
- Technical logs of full-text accesses as billing and publisher evidence — without full-text content.

Searches and external access

- External searches transmit search terms and, where supported by the source, selected filters to external databases or providers. The providers contacted depend on the selected source.
- Do not enter personal information or patient data in search fields. Such information is not automatically removed from search requests.
- A direct publisher link opens the respective provider's service. Full-text availability depends on that service and your organisation's access rights.
- No sale or disclosure of usage data to third parties for advertising purposes.

Direct links

When you open an external full-text link, your browser connects to the provider. The provider receives technical connection data, including the IP address used. This may vary depending on the network, VPN or proxy. Please consult the respective provider's privacy information.

The complete data protection information for Klinik Wissen 360 is provided to your organisation before the contract starts.
